Discount Leakage & Cherry-Picking: The Basket Sabotage

Cherry-pick risk 59/100 (Moderate): give this discount and there is a 63.2% chance the Support line or another offsetting line disappears, costing $156k - 31.9% of the deal's profit.

Seed 42 | Run run_b697f8861b39 | 2,000 scenarios tested | Cluster bootstrap resampling with empir… | 21 Sep 2026, 23:40

Same seed, same numbers - this run can be reproduced exactly.

How this works

We went back through your past multi-line deals and found the ones where a line was discounted past 30%. In those deals we measured how often the other lines were cancelled inside 6 months, and compared it with how often those lines die anyway. That difference is the cherry-pick signal. We then rebuilt this quote 2,000 times, each time re-drawing whole past deals so the answer reflects how much history we actually have, and re-priced the basket with whatever survived. The risk score is three things you can check by hand: how far past your discount limit the ask sits (25%), how likely the offsetting lines are to vanish (50%), and how much of the profit sits in the line being cut (25%).

The numbers that matter

CHERRY-PICK RISK SCORE
59 / 100
Built from three checkable pieces; the biggest one is how likely the offsetting lines are to vanish.
vs Moderate risk

PROFIT LIKELY TO LEAK AWAY
$156k
The profit this deal loses once you allow for how buyers actually behave.
vs 31.9% of the deal's profit

CHANCE THE SUPPORT LINE IS DROPPED
63.2%
How often the line that pays for the discount dies in the first 6 months.
vs 1.7x the normal 37.5%

CHANCE ANY OFFSETTING LINE DIES
63.2%
The odds the basket does not survive intact.

PROFIT EXPOSED ON THE SUPPORT LINE
$95k
$150k of profit with a 63.2% chance of walking.

PROFIT AT RISK
31.9%
Share of the bundle's profit that is exposed to cherry-picking.

PROFIT IF THEY KEEP EVERYTHING
$489k
The spreadsheet number: 54.3% margin on $900k.

PROFIT YOU SHOULD ACTUALLY PLAN FOR
$333k
The honest number after cherry-picking.
vs as low as $39k in a bad run

HOW MUCH MORE OFTEN THE WORST PAIR DIES
1.7x
Deals with a deep Software discount lose the Support line 1.7 times more often than usual.
vs 63.2% vs 37.5%

CHANCE THE BUNDLE ENDS UNDER YOUR 35% FLOOR
10.2%
How often the surviving basket is not worth signing at all.

How we got there

1. What is actually on the table

The basket is worth $900k and makes $489k if nothing is dropped. But 61.3% of that profit sits in Software - the exact line the buyer wants 35% off, which is 5 points past the discount line you set yourself.

Evidence: $300k of $489k profit in Software

2. What history says happens next

In 152 past deals where Software was discounted past 30%, the Support line was cancelled 63.2% of the time against a normal rate of 37.5% - 1.7 times more often. And they do not do it immediately - when a line dies it happens around month 3.

Evidence: source: your own history

3. What the rebuild shows

Rebuilding this quote 2,000 times, the profit lands at $333k on average, and in an unlucky run of twenty it is $39k or worse. There is a 10.2% chance the bundle that survives is worth less than your 35% margin floor.

Evidence: $156k average shortfall

4. What to do about it

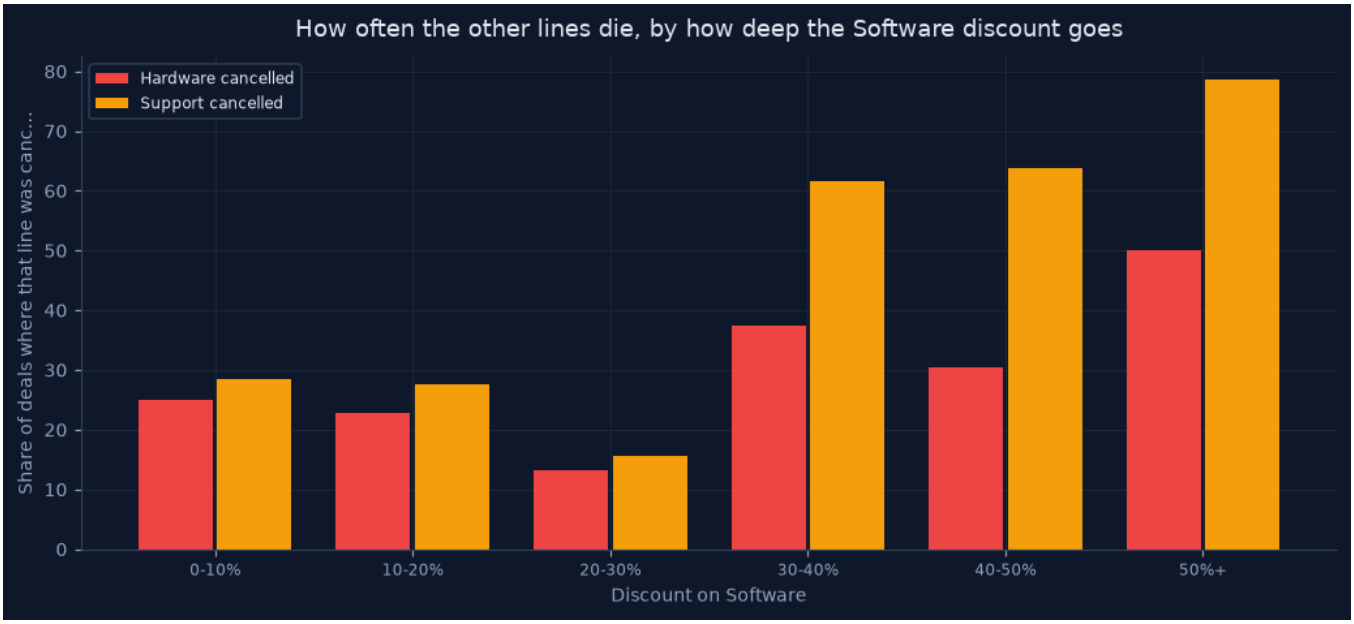

The biggest driver of the score is how likely the offsetting lines are to vanish. Tie the discount to the behaviour: if the Support line is not live at 80% of committed hours by month 6, the 35% Software discount comes off and Software reverts to standard pricing - worth up to $210k back.

Evidence: clawback up to $210k

Charts

How often the other lines die, by how deep the Software discount goes

Each bar is a group of past deals with a similar discount

What this shows: If the bars jump once the discount passes your limit, buyers are not just buying more - they are buying differently. That jump is the cherry-pick signal.

Which discount poisons which line

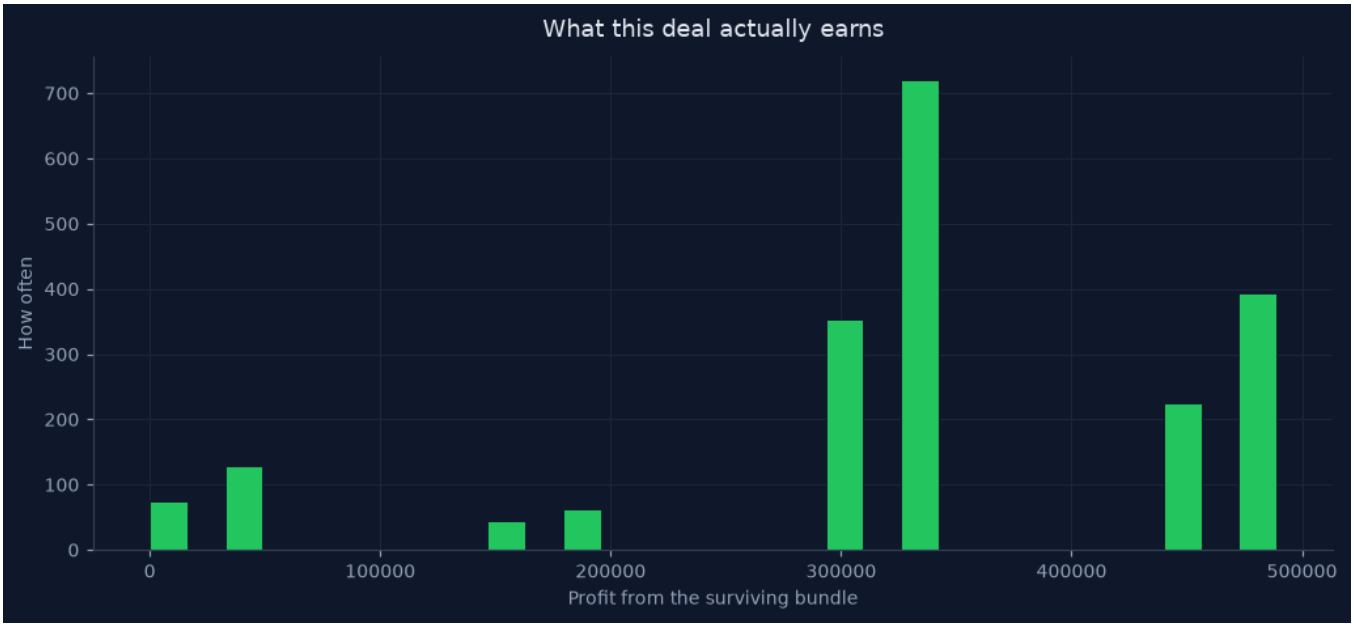

Numbers are 'times more likely than usual' when the row's line is discounted past 30% - rows with too little history are left out

What this shows: Anything above 1.0 means the two events travel together. The hottest cell is the pair you should write a contract clause about.

What this deal actually earns

2,000 rebuilt bundles - the dashed line is the number on the quote

What this shows: The gap between the tall bars and the 'if nothing is dropped' marker is the cost of cherry-picking. The left tail is the bad case you are signing up for.

Tables

The quote, line by line

Where the profit sits, and how exposed each line is.

Line	List price	Discount	Price after discount	Your margin	Profit	Share of profit	Chance it is dropped	Profit at risk
Software	$600,000	35.0%	$390,000	85.0%	$300,000	61.3%	15.1%	$45,395
Hardware	$300,000	5.0%	$285,000	18.0%	$39,000	8.0%	36.2%	$14,112
Support	$250,000	10.0%	$225,000	70.0%	$150,000	30.7%	63.2%	$94,737

Row 1 carries the discount being asked for.

What happens to each line when another line is discounted past 30%

Read across a row: 'when THIS line is deeply discounted, the chance THAT line dies'. A figure above 1.0 means the two events travel together.

Discounted line (A)	Line that dies (B)	Deals like this	Normal rate	Rate after the discount	Times more often	Link strength
Hardware	Hardware	20	25.2%	40.0%	1.58x	weak
Hardware	Services	20	24.5%	30.0%	1.22x	none
Hardware	Software	20	13.0%	15.0%	1.15x	none
Hardware	Support	20	37.5%	60.0%	1.60x	weak
Services	Hardware	24	25.2%	16.7%	0.66x	none
Services	Services	24	24.5%	16.7%	0.68x	none
Services	Software	24	13.0%	8.3%	0.64x	none
Services	Support	24	37.5%	33.3%	0.89x	none
Software	Hardware	152	25.2%	36.2%	1.43x	clear
Software	Services	152	24.5%	30.3%	1.24x	weak
Software	Software	152	13.0%	15.1%	1.16x	none
Software	Support	152	37.5%	63.2%	1.68x	strong

Rows where the second line dies far more often than normal are the cherry-pick signature.

What the bundle actually earns

Every one of the 2,000 rebuilt bundles, summarised.

Scenario	Profit	Margin	Versus the plan
If they keep everything	$489,000	54.3%	the number on the quote
Most likely outcome	$339,000	37.7%	-$150,000
A bad run (1 in 20)	$39,000	4.3%	-$450,000
Worst bundle we saw	$0	0.0%	-$489,000

Row 2 is the number to plan with.

Does the buyer's tier change the behaviour?

Same test, split by customer tier (only tiers with enough history are shown).

Customer tier	Deals	Deals with a deep discount	Chance each offsetting line dies
Enterprise	107	46	37%, 59%
Mid-Market	172	60	38%, 65%
SMB	121	46	33%, 65%

Use the worst tier as your planning number if you do not know the buyer well.

What we recommend

Approve the 35% only as a conditional discount - expect to lose $156k if you do not tie it to the Support line.

Risk Moderate 59 out of 100 | Confidence: High

Why

• 61.3% of this deal's profit sits in Software, the line being cut by 35%.

• Past deals like this one lose the offsetting lines 63.2% of the time (your own history).

• Expected profit after cherry-picking is $333k, not $489k - a $156k gap.

What to do

1. Make the 35% Software discount conditional: if the Support line is not live at 80% of committed hours by month 6, Software pricing reverts to the standard tier (recovering up to $210k).

2. Do not let them drop one offsetting line and keep the other: make the discount conditional on the whole Hardware, Support basket surviving, not on any single line.

3. Put the test at month 6, not at signature - past buyers who walk do it around month 3.

4. There is a 10.2% chance the surviving bundle sits under your 35% floor - require CF sign-off above 30% on any single line.

The trade-off: Walking away from the 35% risks the deal; giving it unprotected costs about $156k. The clause lets you keep the deal and cap the loss. If the buyer refuses any condition, the mildest version is to cap Software at 30%, which still protects $30k.

What we assumed and what to watch

Worth knowing before you act

• Some category pairs rest on fewer than 30 past deals, so those figures are rough. The headline pair is the one with enough history behind it.

Assumptions

• Quote under review: Software $600,000 at 35% off (85.0% margin), Hardware $300,000 at 5% off (18.0% margin), Support $250,000 at 10% off (70.0% margin).

• Deep discount means anything past 30%; a line counts as abandoned if it dies within 6 months.

• Abandonment rates come from your own history: 400 past deals, 203 deep-discount category observations.

• Risk score = 25% x how far past your discount limit the ask sits (10 points past = full marks) + 50% x chance an offsetting line dies + 25% x share of profit sitting in the discounted line.

• A cancelled line is treated as fully lost: no revenue and no cost.

• Bundle margin floor 35%; minimum support commitment 80% of hours.

• We replayed 2,000 bundles built from your own past deals; seed 42 - re-running gives identical numbers.

• Quote / deal ID -> your 'quote_id' column

• Customer tier / segment -> your 'customer_tier' column

• Line item ID -> your 'line_id' column

• Product line name -> your 'product_line' column

• Line category -> your 'category' column

• List price of the line -> your 'list_price' column
